

## RETURN YOUR SPONTANEITY

PT-141 is a new innovative peptide hormone treatment that works for both men and women to improve sexual function. PT-141 is an effective and efficient treatment for both erectile dysfunction and increased libido in men and improves female sexual arousal disorder in women.

### WHAT IS PT-141?

Bremelanotide PT-141 peptide solution allows you can experience improved sexual function, desire, and satisfaction once again. Ideal for both men and women, PT-141 is an effective treatment option to improve symptoms of erectile dysfunction as well as issues associated with sexual arousal disorder. PT-141 peptide gives you the desire and motivation needed to return the intimacy and passion to your relationship.

### HOW DOES IT WORK?

Bremelanotide PT-141 is a sexual arousal aid that affects the nervous system rather than the cardiovascular system. Many current sexual enhancement alternatives (such as oral sexual performance medications) cause changes in the vascular system, which can have negative effects for individuals. It works directly through the nervous system to increase blood flow to the genitals, stimulating sexual desire and reigniting the passion once lost to symptoms of sexual dysfunction.

PT-141 addresses those issues to help resolve sexual difficulties.

Some important notes on the causes of sexual dysfunction:

- Causes are typically medical, but can be psychological such as guilt, depression, severe anxiety, fear of intimacy, and past sexual trauma
- An underlying medical condition
- Prescription drugs, recreational drugs, alcohol, and smoking can all contribute to decreased sexual performance
- Problems with blood flow, nerve supply and hormones can have a negative impact on sexual function.

### BENEFITS OF PT-141

- Better sexual performance
- Enhanced sexual arousal and increased libido
- Reduced or eliminated symptoms of erectile dysfunction (in men)
- A healthier, happier relationship between partners
- Improved mood and quality of life
- Regained self-esteem and self-confidence
- Lowered stress and reduced feelings of depression

Sexual dysfunction prevents couples from experiencing satisfaction from sexual activity. **Although sexual dysfunction can affect any age**, it is more common in those over 40. Many are hesitant to discuss, but you have **treatment options**, so it's essential to have the conversation with your partner and provider.
